

1. Types of flows

- Screen flow: use flow builder to create an interaction that presents info and asks your users questions.

- Record - Triggered flow: use flow builder to create automation that runs when a record is created, edited or deleted.

2. Automation ideas

Examples:

1. Guide a site member through requesting a new credit card with a step-by-step walkthrough.
2. When a support tech clicks an escalate button on a case, reassign the case to a higher level tech.
3. When a platform event occurs, create a task

10, when a opportunity closes, create a renewal opportunity.

11, update a lead record in salesforce after a certain amount of time passes, or when a specified time is reached.

3, Flow builder

Ans: The primary tool for creating flows.

* flow builder is salesforce's visual automation tool that lets admins, creators and developers create business processes without writing code. It uses a drag-and-drop interface to build flows that collect information, update records, and automate tasks based on user actions or system events.

4. Your flow diagram

Flow design:

Automatically Sending mail (Admission confirmation mail to students) when his/her application is approved.

⇒ we use record triggered flow

⇒ object: opportunity

⇒ stage: equals → closed won

⇒ send mail to student (account → contact details)

⊙ record triggered flow

⚡ → send email

Action

End

⇒ Recipient address

⇒ & Record Contact -> Email

5, Manual vs automated process

Ans: Manual Process:

- A user must open salesforce, find the correct record, and update fields manually.
- This is slower and can lead to errors or missed steps

Automated process:

- Flow builder runs the logic automatically based on record changes or user input.
- This reduces manual work, ensures consistency, and improves accuracy.
